

Topic 3: AI for Blog Writing and Articles

3.1 Blog Writing Workflow with AI

- Step 1 -- Research: use Perplexity AI (with citations) or ChatGPT with browsing to gather key points and data
- Step 2 -- Outline: ask AI for a detailed structure with sections and 3 key points per section
- Step 3 -- Draft: expand each section with AI, one section at a time for better quality and control
- Step 4 -- Edit: review every paragraph for accuracy, add personal insight, fix generic phrasing
- Step 5 -- Optimise: ask AI to suggest a meta description, title tag variations, and internal link opportunities
- The research and drafting phase can be significantly compressed compared to writing from scratch

Step 2 -- outline prompt:

```
'Create a detailed outline for a 1,500-word blog post titled:
"5 Ways AI is Changing Project Management".
Target audience: mid-level project managers with no AI background.
Include: an opening hook, 5 main sections with 3 sub-points each,
a real-world example for each section, and a conclusion with CTA.
Avoid: jargon, hype, and vague claims.'
```

3.2 Types of Articles AI Handles Well

- How-to articles: prompt with numbered steps; ask AI to expand each step with detail and an example
- Listicles: 'Write a listicle with 7 items, each with a 2-sentence explanation and a concrete example'
- Opinion pieces: provide your thesis and 3 supporting arguments, ask AI to develop them into paragraphs
- Case studies: provide the facts and outcome; ask AI to structure them as a narrative with problem/solution/result
- Interview Q&A: generate questions with AI; use AI to clean up rough transcript notes into polished Q&A format

3.3 Quality Checks for AI-Generated Articles

- Fact-check every specific statistic, date, name, and citation -- AI confidently fabricates details
- Originality: if the piece reads like a generic overview that anyone could write, add unique angles only you can provide

- Readability: target an 8th-grade reading level for general audiences (Hemingway Editor helps assess this)
- AI detection awareness: tools like Turnitin and GPTZero can flag AI-generated text -- thorough editing reduces detectability
- Plagiarism check: AI output is usually original, but run through Copyscape for important published pieces

3.4 Consistency Across a Blog

- Style guide prompt: create a persistent system message defining your writing rules and reuse it each session
 - Terminology consistency: 'We always say CX, not UX; we use Oxford commas; we spell out numbers under 10'
 - Series cohesion: include summaries of related previous articles when generating new ones in a series
 - Brand glossary: maintain an approved/banned terms list; include it in your writing prompt template
-
